

Development of operating models for a district-heating network

The municipality of Rüschlikon is planning to build a district-heating network that makes use of lake water as a source of heat. Working on behalf of the municipality, we developed various operating models to account for the network's planning, realization, and operation. To arrive at our models, we first assigned the various functions – business operation, investments, financing, technical tasks, and commercial tasks in various coherent combinations – to the municipality of Rüschlikon and prospective partners. We then supported the municipality in its efforts to recruit suitable partners for the realization of the selected model.

Our services

- Development of various operating models
- Systematic evaluation of the developed models
- Recruitment of suitable partners

Client

Municipality of Rüschlikon

Facts

Period	2019
Project Country	Switzerland
Commission volume	CHF 10,000
