

Supply and waste management infrastructure

We support our clients when it comes to the planning, management and realization of various construction projects in the area of supply and waste management infrastructure. The scope of our services includes all project phases and projects of all sizes.

We are active in the following areas:

- Sewage systems for all kinds of wastewater
- Water treatment systems for street and highway drainage water
- Property drainage systems, including water retention and diversion
- Water pipelines
- Gas pipelines
- Power lines and telephone lines
- Electric power transmission routing and routing of all other kinds of cable, including high-voltage underground power lines
- Coordination of extensive power and water-supply and sewage systems projects

In approaching our work, we remain committed to assembling cohesive interdisciplinary teams of specialists from various areas of engineering, including road construction, railway construction, foundation construction, structural engineering, energy supply systems and environmental consulting. This allows us to create optimum value for our clients.

We are currently working on various power and water-supply and sewage systems projects in the Zurich metropolitan area and throughout Switzerland.
