

Technical coordination

Technical coordination is a unifying task that is constantly developing due to continuing technological advances, as well as structural and architectural challenges. The use of 3-D planning and BIM-ready tools enables us to respond today to the challenges of tomorrow.

We have broad interdisciplinary knowledge and experience in all technical and construction matters and can offer our expert services in the spatial and technical coordination of the various individual disciplines participating in a complex project:

We have provided our expert technical and spatial coordination services in projects such as the security control building and the VIP lounge of Zurich airport. Other projects include the full restoration of listed properties, such as Zurich central train station, Villa Patumbah, Stadthaus Zurich and the reconstruction of the Zunfthaus zur Zimmerleuten. The Dolder Grand Hotel is another shining example in our project portfolio.
